On the Basicity of Organic Bases in Different Media

Sofja Tshepelevitsh, Agnes Kütt, Märt Lõkov, Ivri Kaljurand, Jaan Saame, Agnes Heering, Paul Plieger, Robert Vianello, Ivo Leito

Table 1. pK_{aH} data for simple nitrogen bases in different media. Most nonobvious structures are depicted in Scheme 1.^[a] See the full paper (<https://doi.org/10.1002/ejoc.201900956>) for references, equations and schemes cited here.

| Compound name | CAS Number | $pK_{aH}(H_2O)$ | $pK_{aH}(DMSO)$ | $pK_{aH}(MeCN)$ | $pK_{aH}(THF)^{[b]}$ | GB (kcal mol ⁻¹) ^[c] |
|---|------------|-----------------------|-------------------------|---------------------------|-------------------------|---|

^[a] Where no experimental or reasonably reliable estimated value was available from the literature, the pK_{aH} values were estimated from the data of a few structurally similar compounds or using equations 5-7, whichever was deemed more reliable.

The values were not estimated for compounds of the types underrepresented in the training set or problematic for the corresponding model (see Table 2) and the respective cells are blank. Uncertainty estimates given in the table are with *ca* 90% coverage probability.

- [b] The pK_{aH} values in THF refer to free-ion basicities and have been estimated from ion-pair basicities (pK_{ip}) using the Fuoss equation. In original publications^[37] these values are termed as pK_a to emphasize that they are *estimates* of pK_a (i.e. not directly measured). In this review we do not make distinction between directly measured pK_{aH} values and those that have been estimated from pK_{ip} .
- [c] GB values from the NIST Chemistry WebBook database^[35] if not stated otherwise.
- [d] Estimated with equations 5, 6 or 7.
- [e] The reference where the pK_{aH} value was originally published. The values provided here have been re-evaluated and may slightly differ from the primary source. See the text for the discussion on the uncertainty of the values.
- [f] Average pK_{aH} values of the aliphatic amines (bar benzylamines) with the same number of substituents.
- [g] Calculated with G4MP2 method
- [h] Recommended pK_{aH} values from ref ^[96] (in water) or ref ^[90] (in MeCN). Most of these values are not experimental but obtained by combining information from experiments, computations and/or correlation analysis. Some on these values may not be experimentally observable due to the properties of the specific solvents.
- [i] Calculated value (DFT BP TZVP) from ref ^[2].
